DUAL BAR

DUAL BAR

The bar is an essential element for your safety and the control of your kite. Any feelings and sensations go thru the bar. It must allow the rider to direct the kite in any situations and should not limit the tricks. Because it is in direct contact with your hands, we brought all our attention to the comfort, everything is integrated: the centre piece, the end pieces and the mini harness loop. Reliability, comfort, safety the Dual bar is a must!

DUAL COMPOSITE

The aluminum center piece combined with fiberglass for the main tube and the ends become the perfect weight/ strength ratio mix. We managed a reduced diameter even for the center part for an ideal handling! Positioning the hand over the center is no longer a problem for unhooked riding.

VARIO GRIP

The variable thickness of the EVA gives ideal grip. This double thickness on the top of the bar where the hand pressure is the strongest brings the rider extreme comfort.

ALU CENTER PART

It is the heart of the bar; it must be reliable, comfortable, bringing perfect sliding and needs to integrate the mini harness loop. The aluminum authorized us to design an evasive shape which allows massive sliding angle with minimum friction. Its polished finishing also works to improve the sliding of the rope.

SOFT ENDS

The ends are perfectly covered by the grip in doubled thickness to protect your hands. The ergonomic shape brings you great handling.

INTEGRATED HARNESS LOOP

During long runs in light wind the rider can hook the mini harness loop to the UPS for easier sheet in. It is integrated to the bar and leaves the top of the bar free.
